Foreword

Biological diversity is important for life on Earth and is one of the pillars of sustainable development. Our continued deriving of benefits from biodiversity, both now and for future generations will depend upon how we use it and how our activities impact upon ecosystem functioning and goods and services.

In recent decades, degradation of habitats, pollution and unsustainable use of biological diversity have led to loss of species, thus jeopardizing present and future livelihoods. Overexploitation of resources such as timber in tropical forests and ocean fisheries is a major cause of loss of biodiversity in many ecosystems. Inappropriate methods of fishing, for instance, are a major factor in coral reef degradation. Hunting is a threat to some species, with a negative impact on traditional food sources. Catches of non target endangered species are also cause for concern. Some plant species are also in serious decline due to harvesting at an unsustainable level. The use of destructive practices and intensive technologies increase environmental degradation, and lead to declines in the local economies and societies that they support.

Sustainable use of the components of biological diversity is one of the three objectives of the Convention and is addressed in Article 10, which requires Parties to adopt measures relating to the use of biodiversity to avoid or minimize impacts on biological diversity.

In addition, the 1992 Earth Summit in Rio de Janeiro agreed on a comprehensive strategy for sustainable development, which highlighted the crucial role of sustainable use in maintaining the variability and variety of life, the biodiversity that "feeds and clothes us and provides housing, medicines and spiritual nourishment". Ten years later, the Plan of Implementation of the World Summit on Sustainable Development, reiterated how sustainable use is an effective tool to combat poverty and to achieve sustainable development.

Given that sustainable use entails the utilization of biodiversity in a manner that maintains its potential to meet current and future human needs and aspirations and to prevent its long term decline, it is also an effective tool for achieving the Millennium Development Goals, eradicating extreme poverty and hunger and ensuring environmental sustainability. It can also generate incentives for the conservation and restoration of biodiversity because of the social, cultural and economic benefits that people derive from it.

In order to operationalize the concept, the Conference of the Parties requested the Executive Secretary to assemble practical principles and operational guidelines

to advise Parties and other Governments in their efforts to achieve the sustainable use of biological diversity, within the framework of the ecosystem approach.

The Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity presented in this booklet are based on the assumption that it is indeed possible to use biodiversity in a manner in which ecological processes, species and genetic variability remain above the thresholds needed for long-term viability, and that therefore all resource managers and users have the responsibility to ensure that that use does not exceed these capacities. It is therefore crucial that the biodiversity in ecosystems is maintained, or in some cases recovered, to ensure that those ecosystems are capable to sustain the ecological services on which both biodiversity and people depend.

In this context, the Guidelines are yet another tangible tool in keeping with the commitment of Parties to the Convention to focus on its practical implementation and the target to achieve, by 2010, a significant reduction in the current rate of biodiversity loss, which is at the heart of the Convention's strategic plan.

I urge all concerned to apply the Principles and Guidelines for any consumptive or non consumptive use of biological diversity. Recalling the decisions of the Conference of the Parties, I also invite all Governments to integrate the Guidelines in the development or review of policies, programmes, national legislation and other regulations, sectoral and cross-sectoral plans and programmes addressing uses of biological diversity.

Hamdallah Zedan
Executive Secretary

Introduction

The Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity provide a framework for assisting Governments, indigenous and local communities, resource managers, the private sector and other stakeholders, about how to ensure that their uses of biological diversity will not lead to its long-term decline.

The principles highlight how ecosystems contribute to and maintain cultures, societies and communities. Thus, any adverse impacts on ecosystems can also have an adverse impact on those cultures, societies and communities. Governments should therefore consider the promotion of sustainable use principles and guidelines as additional instruments for the protection and maintenance of traditional cultures and societies.

Because of their interdependence, the fourteen principles should be considered together. However, the principles will not apply equally to all situations. They are of general relevance and should be adapted to different contexts. Their application will vary according to the biodiversity being used, the conditions under which they are being used, and the institutional and cultural context in which the use is taking place.

The practical principles in most instances apply to both consumptive and non-consumptive uses of biodiversity components. They take into account requirements related to policies, laws and regulations; management of biological diversity; socio-economic conditions; and information, research and education.

The principles and guidelines are a valuable tool to promote conservation and contribute to poverty alleviation. However, the application of the principles and guidelines will be most effective when appropriate measures are taken for the protection of biological resources and remediation of the harmful effects of pollution, civil and armed conflicts, displacement of people and other externally derived impacts are being undertaken. The sustainable use of biodiversity will also be enhanced if provisions are made for mitigation, remediation, compensation and /or rehabilitation when biodiversity loss results from overuse.

Finally, it is important to underline that, in many cultures and societies, women are often the primary users and managers of components of biodiversity. It follows that special consideration should be given to involve and empower women in the implementation of these principles and guidelines and, in general, in the management of biodiversity components.

The present publication, which is part of a series of CBD guidelines, is intended to raise awareness and communicate the principles and guidelines to a wider audience and to stimulate the necessary action for their implementation. Success stories and lessons learned from their implementation should be reported to the Secretariat at: secretariat@biodiv.org.

ADDIS ABABA PRINCIPLES AND GUIDELINES FOR THE SUSTAINABLE USE OF BIODIVERSITY

1. The Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity consist of fourteen interdependent practical principles, operational guidelines and a few instruments for their implementation that govern the uses of components of biodiversity to ensure the sustainability of such uses. The principles provide a framework for advising Governments, resource managers, indigenous and local communities, the private sector and other stakeholders about how they can ensure that their use of the components of biodiversity will not lead to the long-term decline of biological diversity. The principles are intended to be of general relevance, although not all principles will apply equally to all situations, nor will they apply with equal rigour. Their application will vary according to the biodiversity being used, the conditions under which they are being used, and the institutional and cultural context in which the use is taking place.
2. Sustainable use is a valuable tool to promote conservation of biological diversity, since in many instances it provides incentives for conservation and restoration because of the social, cultural and economic benefits that people derive from that use. In turn, sustainable use cannot be achieved without effective conservation measures. In this context, and as recognized in the Plan of Implementation of the World Summit on Sustainable Development, sustainable use is an effective tool to combat poverty, and, consequently, to achieve sustainable development.
3. Agricultural biodiversity was not fully addressed in the process leading up to the development of the Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity and there is a need for their further elaboration specifically with respect to domesticated species, breeds and varieties in the context of the programme of work on agricultural biodiversity.
4. The practical principles in most instances apply to both consumptive and non-consumptive uses of biodiversity components. They take into account requirements related to: (i) policies, laws, and regulations;

- (ii) management of biological diversity; (iii) socio-economic conditions; and (iv) information, research and education.
5. It is a fundamental assumption that the application of the practical principles and operational guidelines is set within the context of the ecosystem approach (decision V/6 of the Conference of the Parties). For the practical principles, footnotes provide cross references to the relevant principle(s) of the ecosystem approach.
 6. Progress towards sustainability will require the political will to bring about changes to create the necessary enabling environment at all levels of government and society. The operational guidelines are intended to provide functional advice on the implementation of the principles. These guidelines have been developed taking into account regional and thematic differences and best practices and lessons learned that have been documented in case-studies on the sustainable use of biological diversity in different biomes as well as existing codes of conduct.
 7. The operationalization of the principles will require an enabling institutional, legal and administrative structure at all levels of government and society within each Party. Further, to be effective, policies and regulations that are adopted should ensure that the application of the principles is flexible and adaptable to different local realities and adjustable to specific ecosystems. In this context, seven underlying conditions should be taken into account as a framework for the correct implementation of the principles and guidelines, as listed in section A below.

A. Underlying conditions for sustainable use

8. In structuring a sustainable use programme and the attendant policies, laws and regulations to implement such a programme, there are a few underlying conditions that should be taken into account in government and natural resource management planning:
 - (a) It is possible to use biodiversity components in a manner in which ecological processes, species and genetic variability remain above thresholds needed for long-term viability, and thus all resource managers and users have the responsibility to ensure that use does not exceed these capacities. It is crucial that the biodiversity in ecosystems is maintained, or in some cases recovered, to ensure that those ecosystems are capable to sustain the ecological services on which both biodiversity and people depend;

-
- (b) Ecosystems, ecological processes within them, species variability and genetic variation change over time whether or not they are used. Therefore, governments, resource managers and users should take into account the need to accommodate change, including stochastic events that may adversely affect biodiversity and influence the sustainability of a use;
 - (c) In circumstances where the risk of converting natural landscapes to other purposes is high, encouraging sustainable use can provide incentives to maintain habitats and ecosystems, the species within them, and the genetic variability of the species. Also, for particular species, such as crocodiles, sustainable use has provided substantial incentives for conserving a dangerous animal that represents a threat to humans;
 - (d) The basic necessities of life, such as food, shelter, freshwater and clean air are produced either directly or indirectly from using biological diversity. In addition, biodiversity provides many direct benefits and ecosystem services necessary for life. In many countries, there is complete or substantial dependence on harvested plants and animals by millions of people, often among the poorest, for their livelihoods. Increasingly other uses such as pharmaceuticals for disease prevention and cure are becoming evident and are also met from using biological diversity. Finally, indigenous and local communities and their cultures often depend directly on the uses of biological diversity for their livelihoods. In all of these instances, governments should have adequate policies and capacities in place to ensure that such uses are sustainable;
 - (e) The supply of biological products and ecological services available for use is limited by intrinsic biological characteristics of both species and ecosystems, including productivity, resilience, and stability. Biological systems, which are dependent on cycling of finite resources, have limits on the goods they can provide and services they can render. Although certain limits can be extended to some degree through technological breakthroughs, there are still limits, and constraints, imposed by the availability and accessibility of endogenous and exogenous resources;
 - (f) To ameliorate any potential negative long-term effects of uses it is incumbent on all resource users, to apply precaution in their management decisions and to opt for sustainable use management strategies and policies that favour uses that provide increased

sustainable benefits while not adversely affecting biodiversity. Likewise, Governments should be certain that licensed or authorized sustainable uses of biological diversity are taking such precaution in their management;

- (g) In considering individual guidelines provided below, it is necessary to refer to and apply the provisions of Article 8(j), Article 10(c) and other related provisions and their development in relevant decisions of the Conference of the Parties in all matters that relate to indigenous and local communities.

B. Practical principles, rationale and operational guidelines for the sustainable use of biodiversity

9. Sustainability of use of biodiversity components will be enhanced if the following practical principles and related operational guidelines are applied:

Practical principle 1: Supportive policies, laws, and institutions are in place at all levels of governance and there are effective linkages between these levels.

Rationale: There is need to have congruence in policies and laws at all levels of governance associated with a particular use. For example, when an international agreement adopts a policy regarding use of biodiversity, national¹ laws must be compatible if sustainability is to be enhanced. There must be clear and effective linkages between different jurisdictional levels to enable a "pathway" to be developed which allows timely and effective response to unsustainable use and allows sustainable use of a resource to proceed from collection or harvest through to final use without unnecessary impediment. In most cases the primary means for achieving congruence between local and international levels of governance should be through national Governments.

Operational guidelines

Consider local customs and traditions (and customary law where recognized) when drafting new legislation and regulations;

8 ¹ It is recognized that, throughout the principles, rationale and operational guidelines, the term "national" may mean either national or, as appropriate in some countries, subnational.

Identify existing and develop new supportive incentives measures, policies, laws and institutions, as required, within the jurisdiction in which a use will take place, also taking into account Articles 8(j) and 10(c), as appropriate;

Identify any overlaps, omissions and contradictions in existing laws and policies and initiate concrete actions to resolve them;

Strengthen and/or create cooperative and supportive linkages between all levels of governance in order to avoid duplication of efforts or inconsistencies.

Practical principle 2: Recognizing the need for a governing framework consistent with international² national laws, local users of biodiversity components should be sufficiently empowered and supported by rights to be responsible and accountable for use of the resources concerned³.

Rationale:

Uncontrolled access to biodiversity components often leads to over-utilization as people try to maximize their personal benefits from the resource while it is available. Resources for which individuals or communities have use, non-use, or transfer rights are usually used more responsibly because they no longer need to maximise benefits before someone else removes the resources. Therefore sustainability is generally enhanced if Governments recognize and respect the "rights" or "stewardship" authority, responsibility and accountability to the people who use and manage the resource, which may include indigenous and local communities, private landowners, conservation organizations and the business sector. Moreover, to reinforce local rights or stewardship of biological diversity and responsibility for its conservation, resource users should participate in making decisions about the resource use and have the authority to carry out any actions arising from those decisions.

Operational guidelines

Where possible adopt means that aim toward delegating rights, responsibility, and accountability to those who use and/or manage biological resources;

² Where consistency with international law is referred to this recognizes: (i) that there are cases where a country will not be a party to a specific international convention and accordingly that law will not apply directly to them; and (ii) that from time to time countries are not able to achieve full compliance with the conventions to which they are a party and may need assistance.

³ See principle 2 of the ecosystem approach.

Review existing regulations to see if they can be used for delegating rights; amend regulations where needed and possible; and/or draft new regulations where needed. Throughout local custom and traditions (including customary law where recognized) should be considered;

Refer to the programme of work related to the implementation of Article 8(j) with regard to indigenous and local community issues (decision V/16), implement and integrate tasks relevant for the sustainable use of biodiversity components, in particular element 3, tasks 6, 13 and 14;

Provide training and extension services to enhance the capacity of people to enter into effective decision-making arrangements as well as in implementation of sustainable use methods;

Protect and encourage customary use of biological resources that is sustainable, in accordance with traditional and cultural practices (Article 10(c)).

Practical principle 3: International, national policies, laws and regulations that distort markets which contribute to habitat degradation or otherwise generate perverse incentives that undermine conservation and sustainable use of biodiversity, should be identified and removed or mitigated⁴.

Rationale: Some policies or practices induce unsustainable behaviours that reduce biodiversity, often as unanticipated side effects as they were initially designed to attain other objectives. For example, some policies that encourage domestic over production often generate perverse incentives that undermine the conservation and sustainable use of biological diversity. Eliminating subsidies that contribute to illegal, unreported and unregulated fishing and to over-capacity, as required by the WSSD Plan of Implementation in order to achieve sustainable fisheries, is a further instance of the recognition of the need to remove perverse incentives.

⁴ See principle 4 of the ecosystem approach.

Operational guidelines

Identify economic mechanisms, including incentive systems and subsidies at international, national levels that are having a negative impact on the potential sustainability of uses of biological diversity;

Remove those systems leading to market distortions that result in unsustainable uses of biodiversity components;

Avoid unnecessary and inadequate regulations of uses of biological diversity because they can increase costs, foreclose opportunities, and encourage unregulated uses thus decreasing the sustainability of the use.

Practical principle 4: Adaptive management should be practiced, based on:

(a) Science and traditional and local knowledge;

(b) Iterative, timely and transparent feedback derived from monitoring the use, environmental, socio-economic impacts, and the status of the resource being used; and

(c) Adjusting management based on timely feedback from the monitoring procedures⁵.

Rationale:

Biological systems and the economic and social factors that can affect the sustainability of use of biological diversity are highly variable. It is not possible to have knowledge of all aspects of such systems before a use of biological diversity begins. Therefore, it is necessary for the management to monitor the effects of that use and allow adjustment of the use as appropriate, including modification, and if necessary suspension of unsustainable practices. In this context, it is preferable to use all sources of information about a resource when deciding how it can be used. In many societies traditional and local knowledge has led to much use of biological diversity being sustainable over long time-periods without detriment to the environment or the resource. Incorporation of such knowledge into modern use systems can do much to avoid inappropriate use and enhance sustainable use of components of biodiversity.

⁵ See principles 9 and 11 of the ecosystem approach.

Operational guidelines

Ensure that for particular uses adaptive management schemes are in place;

Require adaptive management plans to incorporate systems to generate sustainable revenue, where the benefits go to indigenous and local communities and local stakeholders to support successful implementation;

Provide extension assistance in setting up and maintaining monitoring and feedback systems;

Include clear descriptions of their adaptive management system, which includes means to assess uncertainties;

Respond quickly to unsustainable practices;

Design monitoring system on a temporal scale sufficient to ensure that information about the status of the resource and ecosystem is available to inform management decisions to ensure that the resource is conserved;

When using traditional and local knowledge, ensure that approval of the holder of that knowledge has been obtained.

Practical principle 5: Sustainable use management goals and practices should avoid or minimize adverse impacts on ecosystem services, structure and functions as well as other components of ecosystems⁶.

Rationale:

For use of any resource there is a need to take into account the functions that resource may fulfil within the ecosystem in which it occurs, and that use must not adversely affect ecosystem functions. For example, clear felling in a watershed could lead to erosion of soil and impairment of the water filtration function of the ecosystem. Avoidance of this situation would involve setting conservative cutting quotas with appropriate harvesting techniques and monitoring the effects of the harvest as it occurs. As another example, the shrimping industry has developed nets that can separate out juveniles and by-catch and also reduce negative effects on benthic and other associated communities.

⁶ See principles 3, 5 and 6 of the ecosystem approach.

Operational guidelines

Ensure management practices do not impair the capacity of ecosystems to deliver goods and services that may be needed some distance from the site of use. For example, selective cutting of timber in a watershed would help maintain the ecosystem's capacity to prevent soil erosion and provide clean water;

Ensure that consumptive and non-consumptive use does not impair the long-term sustainability of that use by negatively impacting the ecosystem and species on which the use depends, paying special attention to the needs of threatened components of biological diversity;

Apply a precautionary approach in management decisions in accordance with principle 15 of the Rio Declaration on Environment and Development;

Identify successful experiences of management of biodiversity components in other countries in order to adapt and incorporate this knowledge in their efforts to resolve their own difficulties;

Where possible consider the aggregate and cumulative impact of activities on the target species or ecosystem in management decisions related to that species or ecosystem;

Where previous impacts have degraded and reduced biodiversity, support formulation and implementation of remedial action plans (Article 10(d)).

Practical principle 6: Interdisciplinary research into all aspects of the use and conservation of biological diversity should be promoted and supported.

Rationale:

International conventions and national decisions that affect use should always apply the best information on which to base decisions and be aware of the local circumstances where a use is undertaken. In addition, there is need to ensure that research is supported into the biological and ecological requirements of the species to ensure that the use remains within the capacity of the species and ecosystem to sustain that use. Further, to enhance incentives that promote sustainability, there

would be value in investing in research to open up new economic opportunities for stakeholders.

Operational guidelines

Ensure that the results of research inform and guide international, national policies and decisions;

Invest in research into techniques and technologies of management of biodiversity components that promote sustainability in both consumptive and non-consumptive uses of biodiversity;

Encourage active collaboration between scientific researchers and people with local and traditional knowledge;

Encourage international support and technology transfer, relating to both consumptive and non-consumptive uses of biodiversity;

Develop cooperation between researchers and biodiversity users (private or local communities), in particular, involve indigenous and local communities as research partners and use their expertise to assess management methods and technologies;

Investigate and develop effective ways to improve environmental education and awareness, to encourage public participation and to stimulate the involvement of stakeholders in biodiversity management and sustainable use of resources;

Investigate and develop means of ensuring rights of access and methods for helping to ensure that the benefits derived from using components of biodiversity are equitably shared;

Make research results available in a form which decision makers, users, and other stakeholders can apply;

Promote exchange programmes in scientific and technical areas.

Practical principle 7: The spatial and temporal scale of management should be compatible with the ecological and socio-economic scales of the use and its impact⁷.

Rationale: Management of sustainable use activities should be scaled to the ecological and socio-economic needs of the

⁷ See principles 2 and 7 of the ecosystem approach.

use. If, for example, fish are harvested from a lake, the owner of the lake should be in charge of, and accountable for, the management of the lake subject to national or, as appropriate, subnational policy and legislation

Operational guidelines

Link responsibility and accountability to the spatial and temporal scale of use;

Define the management objectives for the resource being used;

Enable full public participation in preparation of management plans to best ensure ecological and socio-economic sustainability.

In case of transboundary resources, it is advisable that appropriate representation from those states participate in the management and decisions about the resources.

Practical principle 8: There should be arrangements for international cooperation where multinational decision-making and coordination are needed.

Rationale:

If a biodiversity resource is transboundary between two or more countries then it is advisable to have a bilateral or multilateral agreement between those states to determine how the resource will be used and in what amounts. Absence of such agreements can lead to each state implementing separate management regimes which, when taken together, may mean that the resource is over-utilized.

Operational guidelines

Make arrangements for international cooperation when the distribution of populations or communities/habitats being used span two or more nations;

Promote multinational technical committees to prepare recommendations for the sustainable use of transboundary resources;

Have bilateral or multilateral agreements between or among the States for the sustainable use of transboundary resources;

Establish mechanisms involving the collaborating states to ensure that sustainable use of transboundary resources does not negatively impact the ecosystem capacity and resilience.

Practical principle 9: An interdisciplinary, participatory approach should be applied at the appropriate levels of management and governance related to the use.

Rationale: Sustainability of use depends on biological parameters of the resources being utilized. However, it is recognized that social, cultural, political and economic factors are equally important. It is therefore necessary to take such factors into consideration and involve indigenous and local communities and stakeholders, including and the private sector, and the people experienced in these different fields, at all levels of the decision making process.

Operational guidelines

Consider providing mechanisms that encourage interdisciplinary cooperation in management of biodiversity components;

Set standards for resource management activities that promote interdisciplinary consultations;

Facilitate communication and exchange of information between all levels of decision-making;

Identify all relevant stakeholders and seek their participation in planning and executing of management activities;

Take account of socio-economic, political, biological, ecological, institutional, religious and cultural factors that could influence the sustainability of the management;

Seek guidance from local, traditional and technical specialists in designing the management plan;

Provide adequate channels of negotiations so that potential conflicts arising from the participatory involvement of all people can be quickly and satisfactorily resolved.

Practical principle 10: International, national policies should take into account:

(a) Current and potential values derived from the use of biological diversity;

(b) Intrinsic and other non-economic values of biological diversity and

(c) Market forces affecting the values and use.

Rationale: Recent work in calculating the potential costs of replacing natural systems with man-made alternatives has shown that such natural systems should be valued very highly. It follows that international and national policies that guide trade and development should compare the real value of natural systems against any intended replacement uses before such development is undertaken. For instance, mangroves have the function of fish-spawning and nursery sites, erosion and storm-surge alleviation and carbon sequestration. Coral reefs provide protection for juvenile fish and many species, as well as coastal zone protection.

Operational guidelines

Promote economic valuation studies of the environmental services of natural ecosystems;

Incorporate this information in policy and decision making processes, as well as educational applications;

Consider this principle in relation to land use/habitat conversion tradeoffs. Recognize that market forces are not always sufficient to improve living conditions or increase sustainability in the use of components of biological diversity;

Encourage governments to take into account biodiversity values in their national accounts;

Encourage and facilitate capacity building for decision makers about concepts related to economic valuation of biodiversity.

Practical principle 11: Users of biodiversity components should seek to minimize waste and adverse environmental impact and optimize benefits from uses.

Rationale: Users should seek to optimize management and to improve selectivity of extractive uses through environmentally friendly techniques, so that waste and environmental impacts are minimized, and socio-economic and ecological benefits from uses are optimized.

Operational guidelines

Eliminate perverse incentives and provide economic incentives for resource managers to invest in development and/or use of more environmentally friendly techniques, e.g., tax exemptions, funds available for productive practices, lower loan interest rates, certification for accessing new markets;

Establish technical cooperation mechanisms in order to guarantee the transfer of improved technologies to communities;

Endeavour to have an independent review of harvests to ensure that greater efficiencies in harvest or other extractive uses do not have a deleterious impact on the status of the resource being used or its ecosystem;

Identify inefficiencies and costs in current methods;

Conduct research and development into improved methods;

Promote or encourage establishment of agreed industry and third party quality standards of biodiversity component processing and management at the international and national levels;

Promote more efficient, ethical and humane use of components of biodiversity, within local and national contexts, and reduce collateral damage to biodiversity.

Practical principle 12: The needs of indigenous and local communities who live with and are affected by the use and conservation of biological diversity, along with their contributions to its conservation and sustainable use, should be reflected in the equitable distribution of the benefits from the use of those resources.

Rationale:

Indigenous and local communities and local stakeholders often shoulder significant costs or forgo benefits of potential use of biological diversity, in order to ensure or enhance benefits accruing to others. Many resources (e.g., timber, fisheries) are over-exploited because regulations are ignored and not enforced. When local people are involved as stakeholders such violations are generally reduced. Management regimes are enhanced when constructive programmes that benefit local communities are implemented, such as capacity training that can provide income alternatives, or assistance in diversifying their management capacities.

Operational guidelines

Promote economic incentives that will guarantee additional benefits to indigenous and local communities and stakeholders who are involved in the management of any biodiversity components, e.g., job opportunities for local peoples, equal distribution of returns amongst locals and outside investors/co-management;

Adopt policies and regulations that ensure that indigenous and local communities and local stakeholders who are engaged in the management of a resource for sustainable use receive an equitable share of any benefits derived from that use;

Ensure that national policies and regulation for sustainable use recognize and account for non-monetary values of natural resources;

Consider ways to bring uncontrolled use of biological resources into a legal and sustainable use framework, including promoting alternative non-consumptive uses of these resources;

Ensure that an equitable share of the benefits remain with the local people in those cases where foreign investment is involved;

Involve local stakeholders, including indigenous and local communities, in the management of any natural resource and provide those involved with equitable compensation for their efforts, taking into account monetary and non-monetary benefits;

In the event that management dictates a reduction in harvest levels, to the extent practicable assistance should be provided for local

stakeholders, including indigenous and local communities, who are directly dependent on the resource to have access to alternatives.

Practical principle 13: The costs of management and conservation of biological diversity should be internalized within the area of management and reflected in the distribution of the benefits from the use⁸.

Rationale: The management and conservation of natural resources incurs costs. If these costs are not adequately covered then management will decline and the amount and value of the natural resources may also decline. It is necessary to ensure that some of the benefits from use flow to the local natural resource management authorities so that essential management to sustain the resources is maintained. Such benefits may be direct, such as entrance fees from visitors to a national park paid directly to, and retained by, the park management authority or indirect, such as stumpage tax revenue from timber harvesting paid by loggers that flows through a national treasury to a local forest service. In some cases licence fees for fishing rights are paid directly to the management authority, or to the national treasury.

Operational guidelines

Ensure that national policies do not provide subsidies that mask true costs of management;

Ensure that harvest levels and quotas are set according to information provided by the monitoring system, not the economic needs of the management system;

Provide guidelines for resource managers to calculate and report the real cost of management in their business plans;

Create other alternative mechanisms to invest revenues from biodiversity management;

Provide economic incentives for managers who have already internalized environmental costs, e.g., certification to access new markets, waiver or deferral of taxes in lieu of environmental investment, promotion of "green-labelling" for marketing.

20 ⁸. See the operational guidance for the application of the ecosystem approach (decision V/6, annex, section C, para. 11).

Practical principle 14: Education and public awareness programmes on conservation and sustainable use should be implemented and more effective methods of communications should be developed between and among stakeholders and managers.

Rationale: To ensure that people are aware of the connectivity between different parts of biological diversity, its relevance to human life, and the effects of uses it is advisable to provide means to engage people in education and awareness of the opportunities and constraints of sustainable use. It is also important to educate people on the relationship of sustainable use and the other two objectives of the Convention. An important way to achieve sustainable use of biological diversity would be to have in place effective means for communications between all stakeholders. Such communications will also facilitate availability of the best (and new) information about the resource.

Operational guidelines

Plan education and public-awareness activities concerning: management, values of sustainable use, changing consumptive patterns and the value of biodiversity in the lives of people;

Ensure that public-awareness programmes also inform and guide decision makers;

Target all levels of the chain of production and consumption with such communications;

Report lessons learned about sustainable use activities to the clearing-house mechanism of the Convention on Biological Diversity;

Encourage and facilitate communication of lessons learned and best practices to other nations;

Ensure that resource users report to government on their activities in a manner that facilitates broader communications;

Increase awareness of the contributions of knowledge, practices and innovations of indigenous and local communities for the sustainable use of biological diversity.

The Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity provide a framework for assisting Governments, indigenous and local communities, resource managers, the private sector and other stakeholders, about how to ensure that their uses of biological diversity will not lead to its long-term decline.

The practical principles in most instances apply to both consumptive and non-consumptive uses of biodiversity components. They take into account requirements related to policies, laws and regulations; management of biological diversity; socio-economic conditions; and information, research and education.

The present publication, which is part of a series of CBD guidelines, is intended to raise awareness and communicate the principles and guidelines to a wider audience and to stimulate the necessary action for their implementation. Success stories and lessons learned from their implementation should be reported to the Secretariat at: secretariat@biodiv.org
